

Euclid, Book I, Proposition I.2

To Place at a Given Point a Straight Line Equal to a Given Straight Line

CGJteamLab

August 6, 2026

This note compares Euclid's original construction for Proposition I.2 with its reconstruction over the Hilbert foundation. In the CGJteamLab development the proposition follows immediately from Book Zero #49 (Layoff), illustrating the difference between the architectural roles of segment construction in Euclid's geometry and the Hilbert axiomatic framework.

1 Statement

Given a point A and a segment BC , construct a point D such that

$$AD \cong BC.$$

2 Euclid's Classical Construction

Figure 1: Euclid's construction for Proposition I.2. The equilateral triangle DAB is constructed first. The sides DA and DB are then produced beyond A and B . The circle with center B and radius BC determines G , and the circle with center D and radius DG determines L . The resulting segment AL is congruent to the given segment BC .

Euclid's construction proceeds as follows.

1. Construct the equilateral triangle DAB on the segment AB .
2. Produce the side DB beyond B .

3. Produce the side DA beyond A .
4. Draw the circle centered at B with radius BC .
5. Draw the circle centered at D with radius DG .
6. The constructed point L satisfies

$$AL \cong BC.$$

3 Hilbert Reconstruction

The reconstruction over the Hilbert foundation is considerably shorter.

1. Choose any point $E \neq A$.
2. The ray AE is thereby determined.
3. Apply Book Zero #49 (Layoff).
4. Obtain a point D on the ray AE satisfying

$$AD \cong BC.$$

No auxiliary geometric construction is required.

Figure 2: Lay off the segment on a chosen ray.

Book Zero #49 provides a point D on a chosen ray from A such that

$$AD \cong BC.$$

4 Formalization

The formal proof consists of a single application of Book Zero #49.

```
theorem euclid_proposition_2 ...
:= bookZero_49_layoff ...
```

5 Discussion

Thus Proposition I.2 illustrates a fundamental architectural difference between Euclid's geometry and the Hilbert approach.

In Euclid's *Elements*, the transport of a segment is obtained through a sequence of explicit geometric constructions beginning with Proposition I.1.

In contrast, Hilbert incorporates this operation into the congruence axioms. Book Zero encapsulates it in the Layoff Theorem, making Proposition I.2 an immediate consequence.

6 Book Zero #49: Layoff

The proof of Proposition I.2 relies on one of the elementary construction theorems established in Book Zero.

Book Zero #49 (Layoff). Let $A \neq B$ and $C \neq D$. Then there exists a point X on the ray AB such that

$$AX \cong CD.$$

In other words, every nondegenerate segment can be copied onto an arbitrarily chosen ray while preserving its length.

Input

Ray AB

A----->

Segment CD

C-----D

|

| Book Zero #49

v

Output

A-----X----->

AX congruent CD

This theorem provides the fundamental operation of transporting segments. Once it is available, Euclid's Proposition I.2 becomes an immediate consequence.
